Abstract

We prove the following theorem: For a partially ordered set Q such that every countable subset of Q has a strict upper bound, there is a forcing notion satisfying the countable chain condition such that, in the forcing extension, there is a basis of the null ideal of the real line which is order-isomorphic to Q with respect to set-inclusion. This is a variation of Hechler's classical result in the theory of forcing. The corresponding theorem for the meager ideal was established by Bartoszyński and Kada.

1 Introduction

For $f, g \in \omega^\omega$, we say $f \leq^* g$ if $f(n) \leq g(n)$ for all but finitely many $n < \omega$. The following theorem, which is due to Hechler [7], is a classical result in the theory of forcing (See also [5]).

Theorem 1.1. *Suppose that $(Q, \leq)$ is a partially ordered set such that every countable subset of Q has a strict upper bound in Q , that is, for any countable set $A \subseteq Q$ there is $b \in Q$ such that $a < b$ for all $a \in A$. Then there is a forcing notion $\mathbb{P}$ satisfying the countable chain condition such that, in any forcing extension by $\mathbb{P}$, $(\omega^\omega, \leq^*)$ contains a cofinal subset $\{f_a : a \in Q\}$ which is order-isomorphic to Q , that is,*

1. *for every $g \in \omega^\omega$ there is $a \in Q$ such that $g \leq^* f_a$, and*
2. *for $a, b \in Q$, $f_a \leq^* f_b$ if and only if $a \leq b$.*

Fuchino and Soukup [6, 9] introduced the notion of *spectra*. For a partially ordered set P , the *unbounded set spectrum* of P is the set of cardinals κ such that there is an unbounded set in P of size κ without unbounded subsets of size less than κ . They also defined several variants of spectra, and investigated how to manipulate those spectra of $(\omega^\omega, \leq^*)$ using Hechler's result. In this context, Soukup asked if the statement of Hechler's theorem holds for the meager ideal or the null ideal of the real line with respect to set-inclusion. Bartoszyński and Kada [3] answered the question positively for the meager ideal. In the present paper, we will give a positive answer for the null ideal. These proofs all follow the same general scheme, but there are substantial technical difficulties to overcome in our present context resulting in a more complicated proof.

Keywords: Hechler's theorem, forcing, null set, localization forcing.

As Hechler pointed out in [7], if Q is well-founded, the conclusion of his theorem can be strengthened to say that whenever $a < b$ in Q , not only does f_b dominate f_a , it also dominates all reals constructible from f_a and the set of its predecessors in the cofinal family, i.e., $g \leq^* f_b$ for all $g \in L[\{f_x : x \leq a\}]$. Hjorth has answered a question of Hechler by showing that this stronger conclusion cannot hold if Q is not well-founded.

(Hjorth) There is no sequence of reals $f_n \in \omega^\omega$ such that for each $n < \omega$, $g \leq^* f_n$ for each $g \in \omega^\omega \cap L[\{f_i : i > n\}]$.

(See [4, Theorem 0.5 and preceding discussion].) These results carry over to our context. When Q is well-founded, the proof of Hechler's theorem for the null ideal $\mathcal{N}$ of $[0, 1]$ provides a cofinal family $\{H_a : a \in Q\}$ of Borel sets in $\mathcal{N}$ so that $(\{H_a : a \in Q\}, \subseteq)$ is isomorphic to Q and, moreover, if $a < b$ then for every Borel null set A coded in $L[\{H_x : x \leq a\}]$, we have $A \subseteq H_b$. Moreover, Hjorth's result implies that this stronger conclusion cannot hold if Q is not well-founded. This can be seen as follows. By [2, Theorems 2.2.2 and 2.3.1] and their proofs (which show that the Tukey maps they provide are definable), if $M \subseteq N$ are transitive models of enough of ZFC and in N there is a Borel null set B such that $A \subseteq B$ for every Borel null set A coded in M , then in N there is an $f \in \omega^\omega$ which dominates $\omega^\omega \cap M$. Thus, the existence of a sequence A_n of null Borel sets such that for each $n < \omega$, A_n contains all null Borel sets coded in $L[\{A_i : i > n\}]$ would yield a counterexample to Hjorth's result.

We will work with the null ideal of the Cantor set 2^ω rather than that of $[0, 1]$ or the real line. The distinction between these spaces is unimportant in our work because there are Borel isomorphisms between them which preserve null sets.

2 Combinatorial view of null sets

In this section, we review the relationship between Borel null sets of the Cantor set 2^ω with the standard product measure and combinatorics on natural numbers, which is described in [1].

Choose a strictly increasing function $h \in \omega^\omega$ satisfying $2^{h(n)-h(n-1)} \geq n+1$ for $1 \leq n < \omega$ (for example, just let $h(n) = n^2$). For each $n < \omega$, let $\{C_i^n : i < \omega\}$ be a list of all clopen subsets of 2^ω of measure $2^{-h(n)}$. We assume that such h and C_i^n 's are fixed throughout this paper.

For a function $f \in \omega^\omega$, we define

$$H_f = \bigcap_N \bigcup_{n > N} C_{f(n)}^n.$$

Then H_f is a G_δ null set, and every null set X is covered by H_f for some $f \in \omega^\omega$.

Let $\mathcal{S} = \prod_{n < \omega} [\omega]^{\leq n}$. We call each $\varphi \in \mathcal{S}$ a *slalom*. As in the case of a function, for a slalom $\varphi \in \mathcal{S}$ we define

$$H_\varphi = \bigcap_N \bigcup_{n > N} \bigcup_{i \in \varphi(n)} C_i^n.$$

Then H_φ is a G_δ null set, and the following hold:

1. For $f \in \omega^\omega$ and $\varphi \in \mathcal{S}$, if $f(n) \in \varphi(n)$ holds for all but finitely many $n < \omega$, then $H_f \subseteq H_\varphi$.
2. For $\varphi, \psi \in \mathcal{S}$, if $\psi(n) \subseteq \varphi(n)$ holds for all but finitely many $n < \omega$, then $H_\psi \subseteq H_\varphi$.

Note that the reversed implications in the above statements do not hold in general.

We will now describe a canonical procedure for constructing a nonempty closed set disjoint from H_φ . For a slalom $\varphi \in \mathcal{S}$, define a function $r_\varphi \in \omega^\omega$ by induction on $n < \omega$ as follows: $r_\varphi(0) = 0$, and for $1 \leq n < \omega$, let

$$r_\varphi(n) = \min\{i < \omega : C_i^n \subseteq C_{r_\varphi(n-1)}^{n-1} \setminus \bigcup_{j \in \varphi(n)} C_j^n\}.$$

This induction goes well because, by the choice of h , we have $\mu(C_k^{n-1}) \geq (n+1) \cdot \mu(C_j^n)$ for $j, k < \omega$.

Let $R_\varphi = \bigcap_{n < \omega} C_{r_\varphi(n)}^n$. R_φ is a nonempty closed set, because it is the intersection of a decreasing sequence of nonempty closed sets in a compact space. Let $A_\varphi = \bigcup_{n < \omega} \bigcup_{i \in \varphi(n)} C_i^n$. Then clearly $H_\varphi \subseteq A_\varphi$. By the construction of r_φ , we have $R_\varphi \cap A_\varphi = \emptyset$, and hence $R_\varphi \cap H_\varphi = \emptyset$.

For $\varphi, \psi \in \mathcal{S}$, if $r_\varphi(n) \in \psi(n)$ for infinitely many $n < \omega$, then $R_\varphi \subseteq H_\psi$ and hence $H_\psi \not\subseteq H_\varphi$.

3 Localization forcing

In this section, we will introduce a modified form of *localization forcing* $\mathbb{LOC}$, which is defined in [2, Section 3.1].

Let $\mathcal{T} = \bigcup_{n < \omega} \prod_{i < n} [\omega]^{\leq i}$. A condition p of $\mathbb{LOC}$ is of the form $p = (s^p, F^p)$, where $s^p \in \mathcal{T}$, $F^p \subseteq \omega^\omega$ and $|F^p| \leq |s^p|$. For conditions p, q in $\mathbb{LOC}$, $p \leq q$ if $s^p \supseteq s^q$, $F^p \supseteq F^q$, and for each $n \in |s^p| \setminus |s^q|$ and $f \in F^q$ we have $f(n) \in s^p(n)$.

It is easy to see the following.

1. For each $n < \omega$, the set $\{q \in \mathbb{LOC} : |s^q| \geq n\}$ is dense in $\mathbb{LOC}$.
2. For each $f \in \omega^\omega$, the set $\{q \in \mathbb{LOC} : f \in F^q\}$ is dense in $\mathbb{LOC}$.
3. $\mathbb{LOC}$ is σ -linked, and hence it satisfies ccc.

Let $\mathbf{V}$ be a ground model, and G a $\mathbb{LOC}$ -generic filter over $\mathbf{V}$. In $\mathbf{V}[G]$, let $\varphi_G = \bigcup\{s^p : p \in G\}$. Then $\varphi_G \in \mathcal{S}$ and, for every $f \in \omega^\omega \cap \mathbf{V}$, for all but finitely many $n < \omega$ we have $f(n) \in \varphi_G(n)$.

Let $H_G = H_{\varphi_G}$. Then in $\mathbf{V}[G]$, by the observation in Section 2, for every Borel null set $X \subseteq 2^\omega$ which is coded in $\mathbf{V}$, we have $X \subseteq H_G$.

Now we define a modified form of localization forcing.

Definition 3.1. Define $\mathbb{LOC}^*$ as follows. A condition p of $\mathbb{LOC}^*$ is of the form $p = (s^p, w^p, F^p)$, where

1. $s^p \in \mathcal{T}$, $w^p < \omega$, $F^p \subseteq \omega^\omega$, and
2. $|F^p| \leq w^p \leq |s^p|$.

For $p, q \in \mathbb{LOC}^*$, $p \leq q$ if

3. $s^q \subseteq s^p$, $w^q \leq w^p$, $F^q \subseteq F^p$, and for $n \in |s^p| \setminus |s^q|$ and $f \in F^q$ we have $f(n) \in s^p(n)$;
4. $w^p \leq w^q + (|s^p| - |s^q|)$;
5. For $n \in |s^p| \setminus |s^q|$, we have $|s^p(n)| \leq w^q + (n - |s^q|)$.

We show that the forcing $\mathbb{LOC}^*$ has similar properties to $\mathbb{LOC}$.

Lemma 3.2. For each $n < \omega$, the set $\{q \in \mathbb{LOC}^* : |s^q| \geq n\}$ is dense in $\mathbb{LOC}^*$.

Proof. Easy. □

Lemma 3.3. For each $f \in \omega^\omega$, the set $\{q \in \mathbb{LOC}^* : f \in F^q\}$ is dense in $\mathbb{LOC}^*$.

Proof. Fix $p \in \mathbb{LOC}^*$ and $f \in \omega^\omega$. Define $q = (s^q, w^q, F^q)$ as follows: $|s^q| = |s^p| + 1$, $s^q \restriction |s^p| = s^p$, $s^q(|s^p|) = \{f(|s^p|) : f \in F^p\}$, $w^q = w^p + 1$ and $F^q = F^p \cup \{f\}$. It is easy to see that $q \in \mathbb{LOC}^*$ and $q \leq p$. □

Lemma 3.4. $\mathbb{LOC}^*$ is σ -linked, and hence it satisfies ccc.

Proof. It is easily seen that the set $L = \{p \in \mathbb{LOC}^* : w^p \geq 2 \cdot |F^p|\}$ is dense in $\mathbb{LOC}^*$. For each $s \in \mathcal{T}$ and $w \leq |s|$, let $L_{s,w} = \{p \in L : s^p = s \text{ and } w^p = w\}$. Then $L = \bigcup\{L_{s,w} : s \in \mathcal{T} \text{ and } w \leq |s|\}$ and, for each $s \in \mathcal{T}$ and $w \leq |s|$, any two conditions in $L_{s,w}$ are compatible. □

Let $\mathbf{V}$ be a ground model, and G a $\mathbb{LOC}^*$ -generic filter over $\mathbf{V}$. In $\mathbf{V}[G]$, let $\varphi_G = \bigcup \{s^p : p \in G\}$. Then, by Lemmata 3.2 and 3.3, we have $\varphi_G \in \mathcal{S}$ and, for every $f \in \omega^\omega \cap \mathbf{V}$, for all but finitely many $n < \omega$ we have $f(n) \in \varphi_G(n)$.

Let $H_G = H_{\varphi_G}$. The following proposition follows from the observation in Section 2.

Proposition 3.5. *Let $\mathbf{V}$ be a ground model and G a $\mathbb{LOC}^*$ -generic filter over $\mathbf{V}$. Then in $\mathbf{V}[G]$, for every Borel null set $X \subseteq 2^\omega$ which is coded in $\mathbf{V}$, we have $X \subseteq H_G$.*

As we observed in Section 2, in $\mathbf{V}[G]$, we can define r_{φ_G} and R_{φ_G} from φ_G . Note that, in this context, every $x \in R_{\varphi_G}$ is a random real over $\mathbf{V}$. We can naturally define a $\mathbb{LOC}^*$ -name $\dot{r}$ for r_{φ_G} so that, for $p \in \mathbb{LOC}^*$, if $|s^p| = n$ then p decides the value of $\dot{r} \upharpoonright n$, because $r_{\varphi_G} \upharpoonright n$ depends only on $\varphi_G \upharpoonright n$.

4 Hechler's theorem for the null ideal

In this section, we will construct a ccc forcing notion which yields Hechler's theorem for the null ideal. The idea is to use localization forcing at each step, instead of the dominating real partial order used in Hechler's construction.

Let $(Q, \leq)$ be a partially ordered set such that every countable subset of Q has a strict upper bound in Q , that is, for every countable set $A \subseteq Q$ there is $b \in Q$ such that $a < b$ for all $a \in A$. Extend the order to $Q^* = Q \cup \{Q\}$ by letting $a < Q$ for all $a \in Q$.

Fix a well-founded cofinal subset R of Q . Define the rank function on the well-founded set $R^* = R \cup \{Q\}$ in the usual way. For $a \in Q \setminus R$, let $\text{rank}(a) = \min\{\text{rank}(b) : b \in R^* \text{ and } a < b\}$. For $x, y \in Q^*$, we say $x \ll y$ if $x < y$ and $\text{rank}(x) < \text{rank}(y)$. For $x \in Q^*$, let $Q_x = \{y \in Q : y \ll x\}$.

For $D \subseteq Q$ and $\xi \leq \text{rank}(Q)$, let $D_{<\xi} = \{y \in D : \text{rank}(y) < \xi\}$, $D_\xi = \{y \in D : \text{rank}(y) = \xi\}$, and for $x \in Q$ with $\text{rank}(x) = \xi$, let $D_{\leq x} = \{y \in D_\xi : y \leq x\}$.

For $D \subseteq Q$, let $\bar{D} = \{\text{rank}(x) : x \in D\}$.

For $E \subseteq D \subseteq Q$, we say E is *downward closed in D* if, for $x \in E$ and $y \in D$ if $y \leq x$ then $y \in E$. When E is downward closed in Q , we simply say E is *downward closed*.

Definition 4.1. We define forcing notions $\mathbb{N}_a$ for $a \in Q^*$ by induction on $\text{rank}(a)$. For $a \in Q^*$, the conditions p of $\mathbb{N}_a$ are all objects of the form $p = \{(s_x^p, w_x^p, F_x^p) : x \in D^p\}$ which satisfy the following properties.

1. D^p is a finite subset of Q_a ;
2. For $x \in D^p$, $s_x^p \in \mathcal{T}$, $w_x^p < \omega$, F_x^p is a finite set of $\mathbb{N}_x$ -names for functions in ω^ω , and $|F_x^p| \leq w_x^p$;
3. For $x \in D^p$, $\sum \{w_z^p : z \in D_{\leq x}^p\} \leq |s_x^p|$;
4. For $x, y \in D^p$, if $\text{rank}(x) = \text{rank}(y)$ then $|s_x^p| = |s_y^p|$.

As in the definition of iterated forcing, it is necessary to limit the collection of names in clause 2 so that $\mathbb{N}_a$ is not a proper class. We leave it understood that by a name for an element of ω^ω is meant a nice name for a subset of $(\omega \times \omega)$ in the sense [8, VII 5.11] which is forced by the weakest condition to name an element of ω^ω .

Throughout this paper, for a condition p in $\mathbb{N}_a$, we always use the notation D^p , s_x^p , w_x^p and F_x^p to denote respective components of p . Also, for $p \in \mathbb{N}_a$ and $\xi \in \bar{D}^p$, let l_ξ^p be the length of s_x^p for $x \in D_\xi^p$.

For $p \in \mathbb{N}_a$ and $b \in Q_a$, define $p \upharpoonright b \in \mathbb{N}_b$ by letting $p \upharpoonright b = \{(s_x^p, w_x^p, F_x^p) : x \in D^p \cap Q_b\}$.

For conditions p, q in $\mathbb{N}_a$, $p \leq q$ if:

5. $D^q \subseteq D^p$;
6. For $x \in D^q$, $s_x^p \supseteq s_x^q$, $w_x^p \geq w_x^q$, $F_x^p \supseteq F_x^q$ and, for all $n \in |s_x^p| \setminus |s_x^q|$ and $\dot{f} \in F_x^q$ we have $p \upharpoonright x \Vdash_{\mathbb{N}_x} \dot{f}(n) \in s_x^p(n)$;

7. For $\xi \in \bar{D}^q$ and $x, y \in D_\xi^q$, if $x < y$, then for all $n \in l_\xi^p \setminus l_\xi^q$ we have $s_x^p(n) \subseteq s_y^p(n)$;
8. For $\xi \in \bar{D}^q$, $\sum\{w_x^p : x \in D_\xi^p\} \leq \sum\{w_x^q : x \in D_\xi^q\} + (l_\xi^p - l_\xi^q)$;
9. For $\xi \in \bar{D}^q$, $E \subseteq D_\xi^q$ which is downward closed in D_ξ^q and $n \in l_\xi^p \setminus l_\xi^q$, we have

$$|\bigcup\{s_x^p(n) : x \in E\}| \leq \sum\{w_x^q : x \in E\} + (n - l_\xi^q).$$

Remark 4.2. If $p \leq q$, then for any $\xi \in \bar{D}^q$ and $E \subseteq D_\xi^p$ we can discard the terms with indices not in E from both sides of the inequality in clause 8 (using $w_x^p \geq w_x^q$ from clause 6) to get

$$\sum\{w_x^p : x \in E\} \leq \sum\{w_x^q : x \in E \cap D_\xi^q\} + (l_\xi^p - l_\xi^q).$$

We now verify that Definition 4.1 does indeed define a partial order. (Reflexivity is clear, but we need to prove transitivity.) The simple observation in part (c) of the following proposition justifies not mentioning a in the notation $\leq$ for the order relation on $\mathbb{N}_a$.

Proposition 4.3. *We have the following properties.*

- (a) *For any conditions $p, q \in \mathbb{N}_a$, if $p \leq q$ then for any $b \in Q_a$, $p \upharpoonright b \leq q \upharpoonright b$.*
- (b) *The order relation on $\mathbb{N}_a$ is transitive.*
- (c) *For any $a, b \in Q^*$, if $p, q \in \mathbb{N}_a \cap \mathbb{N}_b$, then $p \leq q$ in $\mathbb{N}_a$ if and only if $p \leq q$ in $\mathbb{N}_b$.*

Proof. (a) and (b) are proven simultaneously by induction on the rank of a . Note that part (b) of the induction hypothesis ensures that for $p, q \in \mathbb{N}_a$ and $x \in D^q \subseteq Q_a$, $\mathbb{N}_x$ is a well-defined partial order and hence the last part of clause 6 makes sense.

(a) All but the last part of clause 6 and clause 8 in the definition of $p \upharpoonright b \leq q \upharpoonright b$ are inherited directly from the corresponding clauses for $p \leq q$. The last part of clause 6 holds because for $x \in D^{q \upharpoonright b} = D^q \cap Q_b$, $(p \upharpoonright b) \upharpoonright x = p \upharpoonright x$. There remains to check clause 8. Let $\xi \in \bar{D}^{q \upharpoonright b}$. Using clause 8 for $p \leq q$ and the fact that $w_x^p \geq w_x^q$ whenever both are defined, we have

$$\begin{aligned} \sum\{w_x^{p \upharpoonright b} : x \in D_\xi^{p \upharpoonright b}\} &= \sum\{w_x^p : x \in D_\xi^{p \upharpoonright b}\} \\ &= \sum\{w_x^p : x \in D_\xi^p\} - \sum\{w_x^p : x \in D_\xi^p \setminus Q_b\} \\ &\leq \sum\{w_x^q : x \in D_\xi^q\} + (l_\xi^p - l_\xi^q) - \sum\{w_x^p : x \in D_\xi^p \setminus Q_b\} \\ &\leq \sum\{w_x^q : x \in D_\xi^q\} + (l_\xi^p - l_\xi^q) - \sum\{w_x^q : x \in D_\xi^q \setminus Q_b\} \\ &= \sum\{w_x^{q \upharpoonright b} : x \in D_\xi^{q \upharpoonright b}\} + (l_\xi^{p \upharpoonright b} - l_\xi^{q \upharpoonright b}). \end{aligned}$$

(b) Suppose that $a \in Q^*$, $p, q, r \in \mathbb{N}_a$ and $p \leq q \leq r$. We must show $p \leq r$.

For the last part of clause 6, suppose we have $x \in D_\gamma^r$, $n \in l_\gamma^p \setminus l_\gamma^r$, $\dot{f} \in F_x^r$. If $n \in l_\gamma^p \setminus l_\gamma^q$, then because $\dot{f} \in F_x^r \subseteq F_x^q$, the fact that $p \leq q$ gives $p \upharpoonright x \Vdash_{\mathbb{N}_x} \dot{f}(n) \in s_x^p(n)$. If $n \in l_\gamma^q \setminus l_\gamma^r$, then the fact that $q \leq r$ gives $q \upharpoonright x \Vdash_{\mathbb{N}_x} \dot{f}(n) \in s_x^q(n)$. We have $s_x^p(n) = s_x^q(n)$ by the first part of clause 6 for $p \leq q$. Also, $p \upharpoonright x \leq q \upharpoonright x$ by part (a). Thus, $p \upharpoonright x \Vdash_{\mathbb{N}_x} \dot{f}(n) \in s_x^p(n)$. We now check clause 9 and leave the other clauses for the reader. Fix $\xi \in \bar{D}^r$, $E \subseteq D_\xi^r$ which is downward closed in D_ξ^r and $n \in l_\xi^p \setminus l_\xi^r$. Let E^q be the downward closure of E in D_ξ^q . If $n \in l_\xi^q \setminus l_\xi^r$, then

$$\begin{aligned} |\bigcup\{s_x^p(n) : x \in E\}| &= |\bigcup\{s_x^q(n) : x \in E\}| \\ &\leq \sum\{w_x^r : x \in E\} + (n - l_\xi^r) \end{aligned}$$

because of clause 9 for $q \leq r$. If $n \in l_\xi^p \setminus l_\xi^q$, then

$$\begin{aligned} |\bigcup \{s_x^p(n) : x \in E\}| &\leq |\bigcup \{s_x^p(n) : x \in E^q\}| \\ &\leq \sum \{w_x^q : x \in E^q\} + (n - l_\xi^q) \\ &\leq \sum \{w_x^r : x \in E\} + (l_\xi^q - l_\xi^r) + (n - l_\xi^q) \\ &= \sum \{w_x^r : x \in E\} + (n - l_\xi^r). \end{aligned}$$

The second inequality follows from clause 9 for $p \leq q$ and the third from Remark 4.2 for $q \leq r$. Hence we have $p \leq r$.

(c) The definition of the order on $\mathbb{N}_a$ makes no mention of a . $\square$

Definition 4.4. For a downward closed set $A \subseteq Q$, let $\mathbb{N}_A = \{p \in \mathbb{N}_Q : D^p \subseteq A\}$, and for $p \in \mathbb{N}_Q$, we define $p \restriction A \in \mathbb{N}_A$ by letting $p \restriction A = \{(s_x^p, w_x^p, F_x^p) : x \in D^p \cap A\}$. For $\xi \leq \text{rank}(Q)$, let $\mathbb{N}_\xi = \mathbb{N}_{Q_{<\xi}}$ and $p \restriction \xi = p \restriction Q_{<\xi}$. Also, for $\xi \leq \text{rank}(Q)$, let $p \restriction \{\xi\} = \{(s_x^p, w_x^p, F_x^p) : x \in D_\xi^p\} \in \mathbb{N}_{\xi+1}$ and $p \restriction [\xi, \infty) = \{(s_x^p, w_x^p, F_x^p) : x \in D^p \setminus Q_{<\xi}\} \in \mathbb{N}_Q$.

In this notation, $\mathbb{N}_a = \mathbb{N}_{Q_a}$ for $a \in Q$, and $\mathbb{N}_Q$ has the same meaning if we consider the subscript Q either as an element of Q^* or as a subset of Q .

Clearly $A \subseteq B \subseteq Q$ implies $\mathbb{N}_A \subseteq \mathbb{N}_B \subseteq \mathbb{N}_Q$. We are going to prove that, if $A \subseteq B$, then $\mathbb{N}_A$ is completely embedded into $\mathbb{N}_B$. This is a fundamental principle of iterated forcing.

The following lemma, which is a special case of this principle, is easily checked.

Lemma 4.5. *If B is a downward closed subset of Q , $\xi \leq \text{rank}(Q)$, $p \in \mathbb{N}_B$ and $q \in \mathbb{N}_{B_{<\xi}}$ extends $p \restriction \xi$, then $q \cup p \restriction [\xi, \infty)$ belongs to $\mathbb{N}_B$ and extends both p and q . In particular, $\mathbb{N}_{B_{<\xi}}$ is completely embedded into $\mathbb{N}_B$.*

Using this lemma, we prove the following.

Lemma 4.6. *For downward closed sets $A, B \subseteq Q$, if $A \subseteq B$, then $\mathbb{N}_A$ is completely embedded into $\mathbb{N}_B$ by the identity map.*

Proof. It is easy to see that the compatibility of conditions in $\mathbb{N}_A$ is the same either in $\mathbb{N}_A$ or in $\mathbb{N}_B$. We show that, for $p \in \mathbb{N}_B$ and $r \in \mathbb{N}_A$, if $r \leq p \restriction A$ then there is $q \in \mathbb{N}_B$ satisfying $q \leq p$ and $q \leq r$. We will proceed by induction on $\sup \bar{A}$.

Suppose that $p \in \mathbb{N}_B$, $r \in \mathbb{N}_A$ and $r \leq p \restriction A$. Let $\gamma = \max \bar{D}^r$. By the induction hypothesis, there is $q_{<\gamma} \in \mathbb{N}_{B_{<\gamma}}$ satisfying $q_{<\gamma} \leq p \restriction \gamma$ and $q_{<\gamma} \leq r \restriction \gamma$.

For $x \in D_\gamma^r$, let $(s_x, w_x, F_x) = (s_x^r, w_x^r, F_x^r)$. For $x \in D_\gamma^p \setminus D_\gamma^r$, let $(s_x, w_x, F_x) = (s_x^p, w_x^p, F_x^p)$.

Let

$$L = \sum \{w_x : x \in D_\gamma^p \cup D_\gamma^r\} + l_\gamma^r.$$

By the induction hypothesis, for each $x \in D_\gamma^p \cup D_\gamma^r$, $\mathbb{N}_x$ is completely embedded into $\mathbb{N}_{B_{<\gamma}}$ and so each $\dot{f} \in F_x$ is an $\mathbb{N}_{B_{<\gamma}}$ -name. Choose $q^* \in \mathbb{N}_{B_{<\gamma}}$ so that $q^* \leq q_{<\gamma}$ and q^* decides the values of $\dot{f} \restriction L$ for all $\dot{f} \in \bigcup \{F_x : x \in D_\gamma^p \cup D_\gamma^r\}$. For $x \in D_\gamma^p \cup D_\gamma^r$ and $n \in L \setminus |s_x|$, let $K_{x,n} \subseteq \omega$ be the set satisfying $q^* \Vdash K_{x,n} = \{\dot{f}(n) : \dot{f} \in F_x\}$.

Define s_x^* for $x \in D_\gamma^p \cup D_\gamma^r$ in the following way: If $x \in D_\gamma^r$, then $|s_x^*| = L$, $s_x^* \restriction l_\gamma^r = s_x$, and for $n \in L \setminus l_\gamma^r$,

$$s_x^*(n) = \bigcup \{K_{z,n} : z \in D_{\leq x}^r\}.$$

If $x \in D_\gamma^p \setminus D_\gamma^r$, then $|s_x^*| = L$, $s_x^* \restriction l_\gamma^p = s_x$, and for $n \in L \setminus l_\gamma^p$,

$$s_x^*(n) = \begin{cases} \bigcup \{s_z(n) : z \in D_{\leq x}^p \cap D_\gamma^r\} \cup \bigcup \{K_{z,n} : z \in D_{\leq x}^p \setminus D_\gamma^r\} & \text{if } l_\gamma^p \leq n < l_\gamma^r \\ \bigcup \{K_{z,n} : z \in (D_\gamma^p \cup D_\gamma^r)_{\leq x}\} & \text{if } l_\gamma^r \leq n < L, \gamma \in \bar{D}^{p \restriction A} \\ \bigcup \{K_{z,n} : z \in D_{\leq x}^p\} & \text{if } l_\gamma^r \leq n < L, \gamma \notin \bar{D}^{p \restriction A} \end{cases}$$

Now we define $q = \{(s_x^q, w_x^q, F_x^q) : x \in D^q\}$ by the following:

1. $D^q = D^p \cup D^{q^*} \cup D_\gamma^r$;
2. For $x \in D^{q^*}$, $(s_x^q, w_x^q, F_x^q) = (s_x^{q^*}, w_x^{q^*}, F_x^{q^*})$;
3. For $x \in D_\gamma^p \cup D_\gamma^r$, $(s_x^q, w_x^q, F_x^q) = (s_x^*, w_x, F_x)$;
4. For $x \in D^p \setminus Q_{<\gamma+1}$, $(s_x^q, w_x^q, F_x^q) = (s_x^p, w_x^p, F_x^p)$.

We now check that $q \in \mathbb{N}_B$. The conditions of Definition 4.1 are satisfied below (resp. above) rank γ because q^* (resp. p) is a condition. Consider what they say at rank γ . The first clause is trivial. The fourth holds because the s_x^q 's all have domain L . The third clause can be checked in two cases.

- (i) If $x \in D_\gamma^r$, then $D_{\leq x}^q = (D^p \cup D^r)_{\leq x} = D_{\leq x}^r$, so $\sum\{w_z^q : z \in D_{\leq x}^q\} = \sum\{w_z^r : z \in D_{\leq x}^r\} \leq l_\gamma^r \leq L$.
- (ii) If $x \in D_\gamma^p \setminus D_\gamma^r$, then $D_{\leq x}^q = D_{\leq x}^p \cup D_{\leq x}^r$, so $\sum\{w_z^q : z \in D_{\leq x}^q\} = \sum\{w_z : z \in D_{\leq x}^p \cup D_{\leq x}^r\} \leq L$.

For the second, all the requirements except that the s_x^q 's are partial slaloms follow from the fact that p and r are conditions. We need to check that $|s_x^*(n)| \leq n$ for each relevant n . If $x \in D_\gamma^r$, then for $l_\gamma^r \leq n < L$, we have $|s_x^*(n)| \leq \sum\{w_z^r : z \in D_{\leq x}^r\} \leq |s_x^r| = l_\gamma^r \leq n$. If $x \in D_\gamma^p \setminus D_\gamma^r$, we consider four cases.

Case 1. $l_\gamma^p \leq n < l_\gamma^r$ and $\gamma \in \bar{D}^{p \upharpoonright A}$. Definition 4.1(9) for $r \leq p \upharpoonright A$ with $E = D_{\leq x}^p \cap D_\gamma^r$ gives

$$\begin{aligned} |s_x^*(n)| &\leq \sum\{w_z^p : z \in E\} + (n - l_\gamma^p) + \sum\{w_z^p : z \in D_{\leq x}^p \setminus E\} \\ &= \sum\{w_z^p : z \in D_{\leq x}^p\} + (n - l_\gamma^p) \\ &\leq l_\gamma^p + (n - l_\gamma^p) = n. \end{aligned}$$

Case 2. $l_\gamma^p \leq n < l_\gamma^r$ and $\gamma \notin \bar{D}^{p \upharpoonright A}$. In this case, $D_{\leq x}^p \cap D_\gamma^r \subseteq D_\gamma^p \cap A = \emptyset$, so $|s_x^*(n)| \leq \sum\{w_z^p : z \in D_{\leq x}^p\} \leq l_\gamma^p \leq n$.

Case 3. $l_\gamma^r \leq n < L$ and $\gamma \in \bar{D}^{p \upharpoonright A}$. Definition 4.1(8) for $r \leq p \upharpoonright A$ gives $\sum\{w_z^r : z \in D_\gamma^r\} \leq \sum\{w_z^p : z \in D_\gamma^{p \upharpoonright A}\} + (l_\gamma^r - l_\gamma^p)$. Removing terms with $z \not\leq x$ from both sides (see Remark 4.2) gives

$$\sum\{w_z^r : z \in D_{\leq x}^r\} \leq \sum\{w_z^p : z \in D_{\leq x}^p \cap A\} + (l_\gamma^r - l_\gamma^p).$$

From the formula for $s_x^*(n)$ we now get

$$\begin{aligned} |s_x^*(n)| &\leq \sum\{w_z^r : z \in D_{\leq x}^r\} + \sum\{w_z^p : z \in D_{\leq x}^p \setminus A\} \\ &\leq \sum\{w_z^p : z \in D_{\leq x}^p \cap A\} + (l_\gamma^r - l_\gamma^p) + \sum\{w_z^p : z \in D_{\leq x}^p \setminus A\} \\ &= \sum\{w_z^p : z \in D_{\leq x}^p\} + (l_\gamma^r - l_\gamma^p) \\ &\leq l_\gamma^p + (l_\gamma^r - l_\gamma^p) = l_\gamma^r \leq n. \end{aligned}$$

Case 4. $l_\gamma^r \leq n < L$ and $\gamma \notin \bar{D}^{p \upharpoonright A}$. In this case we have $|s_x^*(n)| \leq \sum\{w_z^p : z \in D_{\leq x}^p\} \leq l_\gamma^p \leq n$.

Thus, q is a condition.

We now check Definition 4.1(5–9) for $q \leq r$ and $q \leq p$. Clause 5 follows from the definition of q . For clauses 6–9, first note that below rank γ , they hold because $q^* \leq p \upharpoonright \gamma$ and $q^* \leq r \upharpoonright \gamma$. Consider what happens at rank γ . Clause 6 holds because for $x \in D_\gamma^p \cup D_\gamma^r$ and all the relevant values of f and n , we have from the definitions that $q^* \Vdash \dot{f}(n) \in K_{x,n}$ and $K_{x,n} \subseteq s_x^*(n)$. For clause 7, we consider three cases. Let $x < y$ be elements of $D_\gamma^p \cup D_\gamma^r$.

- (i) If $x, y \in D_\gamma^r$, then for checking $q \leq r$, just use the monotonicity of $s_x^*(n)$ as a function of x . For checking $q \leq p$ (so now we assume $x, y \in D_\gamma^p$ as well), we also need to consider values of n such that $l_\gamma^p \leq n < l_\gamma^r$. But then $s_x^*(n) = s_x^r(n) \subseteq s_y^r(n) = s_y^*(n)$ because $r \leq p \upharpoonright A$.

This is the only case to consider for checking clause 7 for $q \leq r$ at stage γ . The remaining cases deal with checking $q \leq p$. Note that if $y \in D_\gamma^r \cap D_\gamma^p = D_\gamma^p \cap A$ then also $x \in D_\gamma^r \cap D_\gamma^p$ since A is downward closed.

(ii) If $x, y \in D_\gamma^p \setminus D_\gamma^r$, use the monotonicity of $s_x^*(n)$ as a function of x .

(iii) If $x \in D_\gamma^r \cap D_\gamma^p$ and $y \in D_\gamma^p \setminus D_\gamma^r$, then consider first a value of n such that $l_\gamma^p \leq n < l_\gamma^r$. We have $s_x^*(n) = s_x(n) \subseteq \bigcup \{s_z(n) : z \in D_{\leq y}^p \cap D_\gamma^r\} \subseteq s_y^*(n)$. Next consider n such that $l_\gamma^r \leq n < L$. We have $s_x^*(n) = \bigcup \{K_{z,n} : z \in D_{\leq x}^r\} \subseteq \bigcup \{K_{z,n} : z \in (D_\gamma^p \cup D_\gamma^r)_{\leq y}\} = s_y^*(n)$.

This takes care of clause 7. Clause 8 follows from the fact that from the definition of L we have $\sum \{w_x : x \in D_\gamma^r \cup D_\gamma^p\} \leq L - l_\gamma^r \leq L - l_\gamma^p$. For clause 9, first we check $q \leq r$. If $E \subseteq D_\gamma^r$ is downward closed in D_γ^r and $l_\gamma^r \leq n < L$, then $|\bigcup \{s_x^*(n) : x \in E\}| = |\bigcup \{K_{x,n} : x \in E\}| \leq \sum \{w_x^r : x \in E\}$. Next we check $q \leq p$. Suppose $\gamma \in \bar{D}^p$ and let $E \subseteq D_\gamma^p$ be downward closed. Consider four cases.

Case 1. $l_\gamma^p \leq n < l_\gamma^r$ and $\gamma \in \bar{D}^{p \upharpoonright A}$. Using Definition 4.1(9) for $r \leq p \upharpoonright A$ and the fact that $E \cap A$ is downward closed in $D^{p \upharpoonright A}$, we have

$$\begin{aligned} |\bigcup \{s_x^*(n) : x \in E\}| &= |\bigcup \{s_x^*(n) : x \in E \cap A\} \cup \bigcup \{s_x^*(n) : x \in E \setminus A\}| \\ &= |\bigcup \{s_x^r(n) : x \in E \cap A\} \cup \bigcup \{K_{x,n} : x \in E \setminus A\}| \\ &\leq \sum \{w_x^{p \upharpoonright A} : x \in E \cap A\} + (n - l_\gamma^p) + \sum \{w_x^p : x \in E \setminus A\} \\ &= \sum \{w_x^p : x \in E\} + (n - l_\gamma^p). \end{aligned}$$

Case 2. $l_\gamma^p \leq n < l_\gamma^r$ and $\gamma \notin \bar{D}^{p \upharpoonright A}$. Then $E \cap A = \emptyset$, and the calculation for case 1 reduces to

$$\begin{aligned} |\bigcup \{s_x^*(n) : x \in E\}| &= |\bigcup \{s_x^*(n) : x \in E \setminus A\}| \\ &= |\bigcup \{K_{x,n} : x \in E \setminus A\}| \\ &\leq \sum \{w_x^p : x \in E \setminus A\} \\ &\leq \sum \{w_x^p : x \in E\} + (n - l_\gamma^p). \end{aligned}$$

Case 3. $l_\gamma^r \leq n < L$ and $\gamma \in \bar{D}^{p \upharpoonright A}$. Let E^r be the downward closure in D_γ^r of $E \cap A = E \cap D_\gamma^{p \upharpoonright A}$. Using Definition 4.1(8) for $r \leq p \upharpoonright A$ and removing terms with $z \notin E^r$ from both sides gives

$$\sum \{w_z^r : z \in E^r\} \leq \sum \{w_z^p : z \in E \cap A\} + (l_\gamma^r - l_\gamma^p).$$

Then we get

$$\begin{aligned} |\bigcup \{s_x^*(n) : x \in E\}| &= |\bigcup \{K_{z,n} : z \in E^r\} \cup \bigcup \{K_{z,n} : z \in E \setminus D_\gamma^r\}| \\ &\leq \sum \{w_z^r : z \in E^r\} + \sum \{w_z^p : z \in E \setminus A\} \\ &\leq \sum \{w_z^p : z \in E \cap A\} + (n - l_\gamma^p) + \sum \{w_z^p : z \in E \setminus A\} \\ &\leq \sum \{w_z^p : z \in E\} + (n - l_\gamma^p). \end{aligned}$$

Case 4. $l_\gamma^r \leq n < L$ and $\gamma \notin \bar{D}^{p \upharpoonright A}$. We have

$$|\bigcup \{s_x^*(n) : x \in E\}| = |\bigcup \{K_{z,n} : z \in E\}| \leq \sum \{w_z^p : z \in E\}.$$

Thus, $q \leq r$. The proof that $q \leq p$ is completed by appealing to Lemma 4.5. $\square$

The following definition and lemma provide a simple mechanism for extending conditions.

Definition 4.7. Let $B \subseteq Q$ be a downward closed set and $\gamma \in \bar{B}$. $p' = \{(s_x^{p'}, w_x^{p'}, F_x^{p'}) : x \in D^{p'}\}$ is a γ -precondition of $\mathbb{N}_B$ if p' satisfies the following:

1. $D^{p'}$ is a finite subset of B ;
2. For $x \in D^{p'}$, $s_x^{p'} \in \mathcal{T}$, $w_x^{p'} < \omega$, $F_x^{p'}$ is a finite set of $\mathbb{N}_x$ -names for functions in ω^ω , and $|F_x^{p'}| \leq w_x^{p'}$;

- 3'. For $x \in D^{p'} \setminus D_\gamma^{p'}$, $\sum\{w_z^{p'} : z \in D_{\leq x}^{p'}\} \leq |s_x^{p'}|$;
4. For $x, y \in D^{p'}$, if $\text{rank}(x) = \text{rank}(y)$ then $|s_x^{p'}| = |s_y^{p'}|$.

For $\xi \in \bar{D}^{p'}$, we will let $l_\xi^{p'}$ be the length of $s_x^{p'}$ for $x \in D_\xi^{p'}$.

For γ -precondition p' of $\mathbb{N}_B$ and $p \in \mathbb{N}_B$, we say p' is a γ -preextension of p if

1. $D^{p'} \supseteq D^p$ and $D^{p'} \setminus Q_{<\gamma+1} = D^p \setminus Q_{<\gamma+1}$;
2. $p' \restriction \gamma \leq p \restriction \gamma$;
3. For $x \in D_\gamma^p$, $s_x^{p'} = s_x^p$, $F_x^{p'} = F_x^p$ and $w_x^{p'} \geq w_x^p$;
4. For $x \in D_\gamma^{p'} \setminus D_\gamma^p$, $F_x^{p'} = \emptyset$ and $w_x^{p'} = 0$;
5. For $x \in D^p \setminus Q_{<\gamma+1}$, $(s_x^{p'}, w_x^{p'}, F_x^{p'}) = (s_x^p, w_x^p, F_x^p)$.

Lemma 4.8. *Let $B \subseteq Q$ be a downward closed set, $p \in \mathbb{N}_B$, $\gamma \in \bar{B}$, $p' = \{(s_x^{p'}, w_x^{p'}, F_x^{p'}) : x \in D^{p'}\}$ a γ -preextension of p such that $D_\gamma^{p'} \neq \emptyset$, and $N < \omega$. Then there is $q \in \mathbb{N}_B$ such that:*

1. $q \leq p$ and $q \restriction \gamma \leq p' \restriction \gamma$;
2. $D_\gamma^q = D_\gamma^{p'}$ and, for $x \in D_\gamma^q$, $s_x^q \supseteq s_x^{p'}$, $w_x^q = w_x^{p'}$ and, $F_x^q = F_x^{p'}$;
3. $D^q \setminus Q_{<\gamma+1} = D^p \setminus Q_{<\gamma+1}$ and, for $x \in D^q \setminus Q_{<\gamma+1}$, $s_x^q = s_x^p$, $w_x^q = w_x^p$ and $F_x^q = F_x^p$;
4. $l_\gamma^q \geq N$.

Proof. Let $L = \max\{\sum\{w_x^{p'} : x \in D_\gamma^{p'}\} + l_\gamma^{p'}, N\}$.

Note that clause 3 in the definition of “ p' is a γ -preextension of p ” ensures that $l_\gamma^{p'} = l_\gamma^p$ as long as the latter is defined, i.e., as long as $\gamma \in \bar{D}^p$.

Using Lemma 4.6, choose $q^* \in \mathbb{N}_{B < \gamma}$ so that $q^* \leq p' \restriction \gamma$ and q^* decides the values of $\dot{f} \restriction L$ for all $\dot{f} \in \bigcup\{F_x^{p'} : x \in D_\gamma^{p'}\} = \bigcup\{F_x^p : x \in D_\gamma^p\}$. For $x \in D_\gamma^{p'}$ and $n \in L \setminus l_\gamma^{p'} = L \setminus l_\gamma^p$, let $K_{x,n} \subseteq \omega$ be the set satisfying $q^* \Vdash K_{x,n} = \{\dot{f}(n) : \dot{f} \in F_x^{p'}\}$. Note that $|K_{x,n}| \leq |F_x^{p'}| \leq w_x^{p'}$.

Define s_x for $x \in D_\gamma^{p'}$ as follows: $|s_x| = L$, $s_x \restriction l_\gamma^{p'} = s_x^{p'}$, and for $n \in L \setminus l_\gamma^{p'}$, if $x \in D_\gamma^p$ then $s_x(n) = \bigcup\{K_{z,n} : z \in D_{\leq x}^p\}$ and if $x \notin D_\gamma^p$ then $s_x(n) = \emptyset$. Now we define $q = \{(s_x^q, w_x^q, F_x^q) : x \in D^q\}$ as follows:

1. $D^q = D^{q^*} \cup D^{p'}$;
2. For $x \in D^{q^*}$, $(s_x^q, w_x^q, F_x^q) = (s_x^{q^*}, w_x^{q^*}, F_x^{q^*})$;
3. For $x \in D_\gamma^{p'}$, $(s_x^q, w_x^q, F_x^q) = (s_x, w_x^{p'}, F_x^{p'})$;
4. For $x \in D^q \setminus Q_{<\gamma+1}$, $(s_x^q, w_x^q, F_x^q) = (s_x^{p'}, w_x^{p'}, F_x^{p'})$.

We now need to check that $q \in \mathbb{N}_B$ and q satisfies the requirement. For $x \in D_\gamma^{p'}$, $l_\gamma^{p'} \leq n < L$, we check that $|s_x(n)| \leq n$ and leave the rest of the verification to the reader. If $x \notin D_\gamma^p$, then $s_x(n) = \emptyset$. Suppose now that $x \in D_\gamma^p$. Then $|s_x(n)| = |\bigcup\{K_{z,n} : z \in D_{\leq x}^p\}| \leq \sum\{w_z^p : z \in D_{\leq x}^p\} \leq |s_x^p| = l_\gamma^p = l_\gamma^{p'} \leq n$. $\square$

Next we prove that $\mathbb{N}_Q$ satisfies ccc.

Lemma 4.9. *Let W be the collection of conditions $q \in \mathbb{N}_Q$ satisfying the following properties:*

1. For all $x \in D^q$, $2 \cdot |F_x^q| \leq w_x^q$;

2. For all $\xi \in \bar{D}^q$, $2 \cdot \sum\{w_x^q : x \in D_\xi^q\} \leq l_\xi^q$.

Then W is dense in $\mathbb{N}_Q$.

Proof. By induction on $\xi \leq \text{rank}(Q)$, we will show that $W_{<\xi}$ is dense in $\mathbb{N}_\xi$.

Fix $p \in \mathbb{N}_\xi$ and let $\gamma = \max \bar{D}^p$. Define a γ -preextension p' of p by the following: $D^{p'} = D^p$, $p' \upharpoonright \gamma = p \upharpoonright \gamma$ and, for $x \in D_\gamma^p$, $s_x^{p'} = s_x^p$, $F_x^{p'} = F_x^p$ and $w_x^{p'} = \max\{w_x^p, 2 \cdot |F_x^p|\}$. Let $N = 2 \cdot \sum\{w_x^{p'} : x \in D_\gamma^p\}$. Applying Lemma 4.8 to p , p' and N , we get a condition $q \leq p$ as in the lemma. By induction hypothesis, there is a condition $q^* \in W_{<\gamma}$, $q^* \leq q \upharpoonright \gamma$. Then $q^* \cup q \upharpoonright \{\gamma\}$ extends q (by Lemma 4.5) and belongs to $W_{<\gamma+1}$. $\square$

Lemma 4.10. $\mathbb{N}_Q$ satisfies ccc.

Proof. Let W be the dense set given by Lemma 4.9. If $A \subseteq W$ is uncountable, then thin A out to an uncountable set $A' \subseteq A$ such that

- (1) $\{\bar{D}^p : p \in A'\}$ is a Δ -system with root u ;
- (2) For $\xi \in u$, there is an l_ξ such that $l_\xi^p = l_\xi$ for all $p \in A'$;
- (3) $\{D^p : p \in A'\}$ is a Δ -system with root U ;
- (4) For $x \in U$, there are s_x and w_x such that $s_x^p = s_x$ and $w_x^p = w_x$ for all $p \in A'$;
- (5) For each $U' \subseteq U$, there is a number $k_{U'}$ such that for each $p \in A'$,

$$\sum\{|F_z^p| : \text{for some } x \in U', z \in D_{\leq x}^p\} = k_{U'}.$$

Note that, because $p \in W$, we have $2k_{U'} \leq \sum\{w_z^p : \text{for some } x \in U', z \in D_{\leq x}^p\}$.

Let p and q be any two conditions in A' . Let $\xi_0 < \xi_1 < \dots < \xi_{k-1}$ be the increasing enumeration of $\bar{D}^p \cup \bar{D}^q$. We will inductively define conditions $r_i \in \mathbb{N}_{<\xi_i+1}$, $i < k$, so that

1. r_i is a common extension of $p \upharpoonright (\xi_i + 1)$ and $q \upharpoonright (\xi_i + 1)$;
2. For each $i < k - 1$, $r_{i+1} \upharpoonright \xi_{i+1} \leq r_i$.

Set $r_{-1} = \emptyset$. When $\xi_i \notin u$, then only one of $\bar{D}^p$, $\bar{D}^q$ contains ξ_i . If $\xi_i \in \bar{D}^p \setminus \bar{D}^q$, then let $r_i = r_{i-1} \cup p \upharpoonright \{\xi_i\}$. Then r_i inherits from r_{i-1} and $p \upharpoonright \{\xi_i\}$ the properties needed for being a condition. It extends $p \upharpoonright (\xi_i + 1)$ by Lemma 4.5. It extends $q \upharpoonright (\xi_i + 1)$ because the inclusion of the domains holds and $q \upharpoonright (\xi_i + 1) = q \upharpoonright (\xi_{i-1} + 1)$, so the relevant values of x and ξ for which $x \in D^q$ or $\xi \in \bar{D}^q$ in clauses 6–9 of Definition 4.1 applied to $r_i \leq q \upharpoonright (\xi_i + 1)$ all have rank at most ξ_{i-1} and hence the clauses hold because $r_{i-1} \leq q \upharpoonright (\xi_{i-1} + 1)$. Similarly if $\xi_i \in \bar{D}^q \setminus \bar{D}^p$.

Now suppose $\xi_i = \gamma \in u$. Proceed as follows.

- (a) Let $L = \sum\{w_x^p : x \in D_\gamma^p\} + \sum\{w_x^q : x \in D_\gamma^q\} + l_\gamma$.
- (b) Get $r^* \in \mathbb{N}_{<\gamma}$, $r^* \leq r_{i-1}$ which decides the values of $\dot{f} \upharpoonright L$ for $f \in F_x^p$, $x \in D_\gamma^p$ and $f \in F_x^q$, $x \in D_\gamma^q$. For $n \in L$, let $K_{x,n}$ be the set such that
 - (i) $r^* \Vdash \{\dot{f}(n) : \dot{f} \in F_x^p\} = K_{x,n}$, if $x \in D_\gamma^p \setminus D_\gamma^q$;
 - (ii) $r^* \Vdash \{\dot{f}(n) : \dot{f} \in F_x^q\} = K_{x,n}$, if $x \in D_\gamma^q \setminus D_\gamma^p$;
 - (iii) $r^* \Vdash \{\dot{f}(n) : \dot{f} \in F_x^p \cup F_x^q\} = K_{x,n}$, if $x \in D_\gamma^p \cap D_\gamma^q$.

Note that

$$\begin{aligned} |\bigcup\{K_{x,n} : x \in D_\gamma^p \cup D_\gamma^q\}| &\leq \sum\{w_x^p : x \in D_\gamma^p\} + \sum\{w_x^q : x \in D_\gamma^q\} \\ &\leq 2 \cdot \max(\sum\{w_x^p : x \in D_\gamma^p\}, \sum\{w_x^q : x \in D_\gamma^q\}) \\ &\leq l_\gamma \end{aligned}$$

where the last inequality holds because $p, q \in W$.

(c) For n such that $l_\gamma \leq n < L$, define $s_x(n)$ as follows.

- (i) $s_x(n) = \bigcup\{K_{z,n} : z \in D_{\leq x}^p \text{ or for some } z' \in D_\gamma^p \cap D_\gamma^q, z \in (D^p \cup D^q)_\gamma \text{ and } z \leq z' \leq x\}$, if $x \in D_\gamma^p \setminus D_\gamma^q$;
- (ii) $s_x(n) = \bigcup\{K_{z,n} : z \in D_{\leq x}^q \text{ or for some } z' \in D_\gamma^p \cap D_\gamma^q, z \in (D^p \cup D^q)_\gamma \text{ and } z \leq z' \leq x\}$, if $x \in D_\gamma^q \setminus D_\gamma^p$;
- (iii) $s_x(n) = \bigcup\{K_{z,n} : z \in (D^p \cup D^q)_{\leq x}\}$, if $x \in D_\gamma^p \cap D_\gamma^q$.

Suppose $E \subseteq D_\gamma^p$ is downward closed. Then

$$\begin{aligned} \bigcup\{s_x(n) : x \in E\} &= \bigcup\{K_{z,n} : z \in (D^p \cup D^q)_{\leq x} \text{ for some } x \in E \cap U\} \\ &\quad \cup \bigcup\{K_{z,n} : z \in E \text{ and for no } x \in E \cap U \text{ do we have } z \leq x\}. \end{aligned}$$

So

$$\begin{aligned} |\bigcup\{s_x(n) : x \in E\}| &\leq \sum\{|F_z^p| : z \in D_{\leq x}^p \text{ for some } x \in E \cap U\} \\ &\quad + \sum\{|F_z^q| : z \in D_{\leq x}^q \text{ for some } x \in E \cap U\} \\ &\quad + \sum\{|F_z^p| : z \in E \text{ and for no } x \in E \cap U \text{ do we have } z \leq x\} \\ &\leq 2k_{E \cap U} \\ &\quad + \sum\{|F_z^p| : z \in E \text{ and for no } x \in E \cap U \text{ do we have } z \leq x\} \\ &\leq \sum\{w_z^p : z \in D_{\leq x}^p \text{ for some } x \in E \cap U\} \\ &\quad + \sum\{w_z^p : z \in E \text{ and for no } x \in E \cap U \text{ do we have } z \leq x\} \\ &= \sum\{w_z^p : z \in E\}. \end{aligned}$$

Similarly, if E is a downward closed subset of D_γ^q , then $|\bigcup\{s_x(n) : x \in E\}| \leq \sum\{w_z^q : z \in E\}$.

(d) Let $r_i = r^* \cup \{(s_x, w_x, F_x) : x \in D_\gamma^p \cup D_\gamma^q\}$, where the triples (s_x, w_x, F_x) are obtained as follows.

- (i) Each s_x has domain L , $s_x \upharpoonright l_\gamma = s_x^p$ if $x \in D_\gamma^p$ and $s_x \upharpoonright l_\gamma = s_x^q$ if $x \in D_\gamma^q$. (This is unambiguous if both clauses hold because of item (4) in the list of properties of A' .) For $l_\gamma \leq n < L$, $s_x(n)$ is as defined in (c).
- (ii) We have $w_x = w_x^p$ if $x \in D_\gamma^p$ and $w_x = w_x^q$ if $x \in D_\gamma^q$ (and this is unambiguous if both clauses hold).
- (iii) For $x \in D^p \setminus D^q$, $F_x = F_x^p$. For $x \in D^q \setminus D^p$, $F_x = F_x^q$. For $x \in D^p \cap D^q$, $F_x = F_x^p \cup F_x^q$.

We must check that r_i is as desired. First we check that r_i is a well-defined condition. In Definition 4.1, clause 1 and the first and third statements of clause 2 hold by definition. The second statement holds below rank ξ_i because r^* is a condition. At rank $\gamma = \xi_i$, it holds because for each $x \in (D^p \cup D^q)_\gamma$ and $n < L$, if $n < l_\gamma$ then $|s_x(n)| \leq n$ because p and q are conditions and if $l_\gamma \leq n < L$ then the argument at the end of (b) above shows that $|s_x(n)| \leq l_\gamma \leq n$. For the last statement, we have that $|F_x|$ is bounded by one of $|F_x^p|$, $|F_x^q|$, $|F_x^p| + |F_x^q|$. In all cases, because $p, q \in W$, we have that $|F_x|$ is bounded by either $2 \cdot |F_x^p| \leq w_x^p = w_x$

or $2 \cdot |F_x^q| \leq w_x^q = w_x$. For clause 3, the property is inherited from r^* if the rank of x is less than ξ_i , and, if the rank of x is ξ_i , is inherited from p or q if $\xi_i \in \bar{D}^p \setminus \bar{D}^q$ or $\xi_i \in \bar{D}^q \setminus \bar{D}^p$. Otherwise we have $\sum\{w_x : x \in (D^p \cup D^q)_{\leq x}\} \leq \sum\{w_x^p : x \in D_{\leq x}^p\} + \sum\{w_x^q : x \in D_{\leq x}^q\} \leq l_{\xi_i} \leq L$. Clause 4 is inherited from r^* at ranks below ξ_i and holds by definition at rank ξ_i .

Now we check that r extends p and q . By symmetry, it is enough to check that r extends p . All of the clauses 5–9 in the definition hold below rank ξ_i because $r^* \leq r_{i-1} \leq p \restriction \xi_{i-1} + 1$. Consider now what they say at rank $\gamma = \xi_i$. The inclusion of the domains and all but the last part of 6 hold by definition of r . The last part of 6 holds because if $x \in D_\gamma^p$, $\dot{f} \in F_x^p$ and $l_\gamma \leq n < L$, we chose r^* so that $r^* \Vdash_{\mathbb{N}_{<\gamma}} \dot{f}(n) \in K_{x,n} \subseteq s_x(n)$. Because $\dot{f}$ is a $\mathbb{N}_x$ -name and $\mathbb{N}_x$ is completely embedded in $\mathbb{N}_{<\gamma}$, it follows that $r^* \restriction x = r_i \restriction x$ also forces $\dot{f}(n) \in s_x(n)$.

The proof of clause 7 is a case by case analysis. Suppose $x, y \in D_\gamma^p$, $x < y$ and $l_\gamma \leq n < L$. Each of x and y comes under either (c)(i) or (c)(iii). Since the formulas used there are increasing functions of x , we need only consider the following two cases.

Case 1. $x \in D_\gamma^p \setminus D_\gamma^q$ and $y \in D_\gamma^p \cap D_\gamma^q$. Let $m \in s_x(n)$ and fix z witnessing this. (So, in particular, $m \in K_{z,n}$.) We will show that $K_{z,n} \subseteq s_y(n)$. If $z \in D_{\leq x}^p$, then also $z \in D_{\leq y}^p$, so $K_{z,n} \subseteq s_y(n)$. The other possibility is that for some $z' \in D_\gamma^p \cap D_\gamma^q$, $z \in (D^p \cup D^q)_\gamma$ and $z \leq z' \leq x$. Then $z' \in (D^p \cup D^q)_{\leq y}$, so again $K_{z,n} \subseteq s_y(n)$.

Case 2. $x \in D_\gamma^p \cap D_\gamma^q$ and $y \in D_\gamma^p \setminus D_\gamma^q$. Fix $z \in (D^p \cup D^q)_{\leq x}$. Taking $z' = x$, we have $z \leq z' < y$ witnessing that $K_{z,n} \subseteq s_y(n)$.

For clause 8, we have that $\sum\{w_x : x \in (D^p \cup D^q)_\gamma\} \leq \sum\{w_\gamma^p : x \in D_\gamma^p\} + \sum\{w_\gamma^q : x \in D_\gamma^q\} = L - l_\gamma$ by the definition of L in (a). Finally, clause 9 was checked in (c).

For $i = k - 1$, we get that r_i is a common extension of p and q .

This completes the proof that $\mathbb{N}_Q$ is ccc. $\square$

5 Proof of the main theorem

This section is devoted to the proof of Hechler's theorem for the null ideal. We will show that the forcing notion $\mathbb{N}_Q$ satisfies all the requirements of the theorem.

Lemma 5.1. *For a downward closed set $B \subseteq Q$, $p \in \mathbb{N}_Q$, $\xi \in \bar{D}^p$ and $N < \omega$, there is $q \in \mathbb{N}_B$ such that $q \leq p$ and $l_\xi^p \geq N$.*

Proof. Just apply Lemma 4.8 to $p' = p$ and N . $\square$

Lemma 5.2. *For a downward closed set $B \subseteq Q$, $p \in \mathbb{N}_B$ and $a \in B$, there is $q \in \mathbb{N}_B$ such that $q \leq p$ and $a \in D^q$.*

Proof. We may assume that $a \notin D^p$. Let $\alpha = \text{rank}(a)$.

If $\alpha \notin \bar{D}^p$, then define $q \in \mathbb{N}_B$ by letting $D^q = D^p \cup \{a\}$, $s_a^q = \emptyset$, $w_a^q = 0$, $F_a^q = \emptyset$ and other components of q are the same as p .

Now we assume that $\alpha \in \bar{D}^p$. Define an α -preextension p' of p in $\mathbb{N}_B$ by letting $D^{p'} = D^p \cup \{a\}$, $s_a^{p'}$ is arbitrary with length l_α^p , $w_a^{p'} = 0$, $F_a^{p'} = \emptyset$ and other components of p' are the same as p . Apply Lemma 4.8 to p , p' and $N = 0$, and we get $q \in \mathbb{N}_B$ with $q \leq p$ and $a \in D^q$. $\square$

Lemma 5.3. *For a downward closed set $B \subseteq Q$, $p \in \mathbb{N}_B$ and $a \in D^p$, there is $q \in \mathbb{N}_B$ such that $q \leq p$ and $w_a^q \geq |F_a^q| + 1$.*

Proof. Let $\alpha = \text{rank}(a)$. Define an α -preextension p' of p in $\mathbb{N}_B$ by letting $D^{p'} = D^p$, $w_a^{p'} = w_a^p + 1$ and other components of p' are the same as p . Apply Lemma 4.8 to p , p' and $N = 0$, and we get $q \in \mathbb{N}_B$ as required. $\square$

Lemma 5.4. *For a downward closed set $B \subseteq Q$, $p \in \mathbb{N}_B$, $a \in D^p$ and an $\mathbb{N}_a$ -name $\dot{f}$ for a function in ω^ω , there is $q \in \mathbb{N}_B$ such that $q \leq p$ and $\dot{f} \in F_a^q$.*

Proof. First use Lemma 5.3, and then put $\dot{f}$ into F_a^q . □

Let $\mathbf{V}$ be a ground model and G an $\mathbb{N}_Q$ -generic filter over $\mathbf{V}$. For $a \in Q$, let $G \restriction a = G \cap \mathbb{N}_a = \{p \restriction a : p \in G\}$. Then $G \restriction a$ is an $\mathbb{N}_a$ -generic filter over $\mathbf{V}$.

In $\mathbf{V}[G]$, for $a \in Q$ let $\varphi_a = \bigcup \{s_a^p : p \in G \text{ and } a \in D^p\}$. By Lemmata 5.1 and 5.2, φ_a is defined for every $a \in Q$, and belongs to $\mathcal{S}$.

Lemma 5.5. *In $\mathbf{V}[G]$, for every $a \in Q$ and $f \in \omega^\omega \cap \mathbf{V}[G \restriction a]$, for all but finitely many $n < \omega$ we have $f(n) \in \varphi_a(n)$.*

Proof. Follows from Lemma 5.4 and the definition of $\mathbb{N}_Q$. □

Lemma 5.6. *For $a, b \in Q$, if $a < b$ and $\text{rank}(a) = \text{rank}(b)$, then for all but finitely many $n < \omega$ we have $\varphi_a(n) \subseteq \varphi_b(n)$.*

Proof. Clear from the definition of $\mathbb{N}_Q$. □

For $a \in Q$, let $H_a = H_{\varphi_a}$. Then each H_a is a null subset of 2^ω . We will show that, in $\mathbf{V}[G]$, the set $\{H_a : a \in Q\}$ is order-isomorphic to $(Q, \leq)$ and cofinal in $(\mathcal{N}, \subseteq)$.

Lemma 5.7. *Let $a \in Q$. For a Borel null set $X \subseteq 2^\omega$ which is coded in $\mathbf{V}[G \restriction a]$, we have $X \subseteq H_a$.*

Proof. Follows from Lemma 5.5 and the observation in Section 2. □

Lemma 5.8. *In $\mathbf{V}[G]$, for every null set $X \subseteq 2^\omega$ there is $a \in Q$ satisfying $X \subseteq H_a$.*

Proof. We may assume that X is a Borel set in $\mathbf{V}[G]$. By our assumption that countable subsets of Q have strict upper bounds, and because $\mathbb{N}_Q$ is ccc, X is coded in $\mathbf{V}[G \restriction a]$ for some $a \in Q$, and by Lemma 5.7, we have $X \subseteq H_a$. □

Lemma 5.9. *For $a, b \in Q$, if $a \leq b$ then $H_a \subseteq H_b$.*

Proof. If $a \ll b$, then H_a is coded in $\mathbf{V}[G \restriction b]$ and hence $H_a \subseteq H_b$ follows from Lemma 5.7. If $a < b$ and $\text{rank}(a) = \text{rank}(b)$, then it follows from Lemma 5.6 and the observation in Section 2. □

For each $a \in Q$, let $r_a = r_{\varphi_a}$ and $R_a = R_{\varphi_a}$ as defined in Section 2. As we observed in Section 3, we define an $\mathbb{N}_Q$ -name $\dot{r}_a$ for r_a so that, for $p \in \mathbb{N}_Q$ if $a \in D^p$ and $|s_a^p| = n$ then p decides the value of $\dot{r}_a \restriction n$.

Lemma 5.10. *For $a, b \in Q$, if $a \not\leq b$ then $H_a \not\subseteq H_b$.*

Proof. Suppose that $a \not\leq b$. Since we always have $R_b \cap H_b = \emptyset$ and $R_b \neq \emptyset$, it suffices to show that $R_b \subseteq H_a$.

Fix $p \in \mathbb{N}_Q$ and $M < \omega$. By Lemmata 5.2 and 5.3, we may assume that $a, b \in D^p$ and $w_a^p \geq |F_a^p| + 1$.

We will find $q \leq p$ and $m > M$ which satisfy $q \restriction b(m) \in s_b^q(m)$. This implies that for infinitely many $m < \omega$ we have $r_b(m) \in \varphi_a(m)$, and hence $R_b \subseteq H_a$.

Let $\alpha = \text{rank}(a)$, $\beta = \text{rank}(b)$, $B = \{x \in Q : x \leq b\}$. Note that $a \notin B$ by the assumption. Extend p if necessary to arrange the following.

$$\text{If } B_\alpha \neq \emptyset, \text{ then } B_\alpha \cap D^p \neq \emptyset.$$

(The following observation is not used in the proof, but note for clarity that because of the definition of rank for elements of $Q \setminus R$, the ranks of the elements of a downward closed set need not be an initial segment of the ordinals. For example, if $R = \omega_1$ ordered as usual and Q is R with new elements e_α , where $e_\alpha \leq \alpha$ but no other relations hold other than the ones needed to ensure transitivity, then e_α has rank α and every subset of $\{e_\alpha : \alpha < \omega_1\}$ is downward closed. Thus the assumption $B_\alpha \neq \emptyset$ can fail even if $\alpha < \beta$.)

We set $m = \max\{M, l_\alpha^p\} + 1$.

Using Lemma 5.1, get $p^* \in \mathbb{N}_B$ extending $p \restriction B$ such that $|s_b^{p^*}| \geq m + 1$. By the choice of $\dot{r}_b$, p^* decides the value of $\dot{r}_b(m)$, so let k be such that $p^* \Vdash_{\mathbb{N}_B} \dot{r}_b(m) = k$.

We will construct $q \in \mathbb{N}_Q$ satisfying $q \leq p$ and $q \leq p^*$, using an argument similar to, but somewhat more difficult than, the proof of Lemma 4.6.

The proof which follows is really two similar but different proofs, one for the case where $B_\alpha \neq \emptyset$ and one for the case $B_\alpha = \emptyset$. In order to be able to write as much as possible of the two proofs as one, we will use the abuse of notation $\max\{l_\alpha^{p^*}, l_\alpha^p\}$ to designate $l_\alpha^{p^*}$ when $B_\alpha \neq \emptyset$ and l_α^p when $B_\alpha = \emptyset$ (in which case $l_\alpha^{p^*}$ is actually not defined).

We will be done if we build $q \leq p$ with $k \in s_\alpha^q(m)$. For $x \in D_\alpha^{p^*}$, let $(s_x, w_x, F_x) = (s_x^{p^*}, w_x^{p^*}, F_x^{p^*})$. For $x \in D_\alpha^p \setminus D_\alpha^{p^*}$, let $(s_x, w_x, F_x) = (s_x^p, w_x^p, F_x^p)$. Let

$$L = \sum\{w_x : x \in D_\alpha^p \cup D_\alpha^{p^*}\} + \max\{l_\alpha^{p^*}, l_\alpha^p\} + m + 1.$$

Choose $q_0 \in \mathbb{N}_\alpha$ so that $q_0 \leq p \restriction \alpha$, $q_0 \leq p^* \restriction \alpha$ (and hence also $q_0 \restriction B_{<\alpha} \leq p^* \restriction \alpha$), and q_0 decides the values of $\dot{f} \restriction L$ for all $\dot{f} \in \bigcup\{F_x : x \in D_\alpha^p \cup D_\alpha^{p^*}\}$. For $x \in D_\alpha^p \cup D_\alpha^{p^*}$ and $n \in L \setminus |s_x|$, let $K_{x,n} \subseteq \omega$ be the set satisfying $q_0 \Vdash K_{x,n} = \{\dot{f}(n) : \dot{f} \in F_x\}$. For $x \in D_\alpha^p \cup D_\alpha^{p^*}$ and $n \in L \setminus |s_x|$, if $(x, n) \neq (a, m)$ then let $K'_{x,n} = K_{x,n}$, and let $K'_{a,m} = K_{a,m} \cup \{k\}$. By the assumption that $w_a^p \geq |F_a^p| + 1$, we have $|K'_{x,n}| \leq w_x$ for all $x \in D_\alpha^p \cup D_\alpha^{p^*}$ and $n \in L \setminus |s_x|$.

Define s_x^* for $x \in D_\alpha^p \cup D_\alpha^{p^*}$ as follows. If $x \in D_\alpha^{p^*}$, then $|s_x^*| = L$, $s_x^* \restriction l_\alpha^{p^*} = s_x$, and for $n \in L \setminus l_\alpha^{p^*}$,

$$s_x^*(n) = \bigcup\{K'_{z,n} : z \in D_{\leq x}^{p^*}\}.$$

If $x \in D_\alpha^p \setminus D_\alpha^{p^*}$, then $|s_x^*| = L$, $s_x^* \restriction l_\alpha^p = s_x$, and for $n \in L \setminus l_\alpha^p$,

$$s_x^*(n) = \begin{cases} \bigcup\{s_z(n) : z \in D_{\leq x}^p \cap D_\alpha^{p^*}\} \cup \bigcup\{K'_{z,n} : z \in D_{\leq x}^p \setminus D_\alpha^{p^*}\}, & l_\alpha^p \leq n < \max\{l_\alpha^{p^*}, l_\alpha^p\} \\ \bigcup\{K'_{z,n} : z \in (D_\alpha^p \cup D_\alpha^{p^*})_{\leq x}\}, & \max\{l_\alpha^{p^*}, l_\alpha^p\} \leq n < L \end{cases}$$

Define q_1 by $q_1 = \{(s_x^{q_1}, w_x^{q_1}, F_x^{q_1}) : x \in D^{q_0} \cup D^{p^*} \cup D_\alpha^p\}$ where

1. For $x \in D^{q_0}$, $(s_x^{q_1}, w_x^{q_1}, F_x^{q_1}) = (s_x^{q_0}, w_x^{q_0}, F_x^{q_0})$
2. For $x \in D_\alpha^p \cup D_\alpha^{p^*}$, $(s_x^{q_1}, w_x^{q_1}, F_x^{q_1}) = (s_x^*, w_x, F_x)$
3. For $x \in D^{p^*} \setminus Q_{<\alpha+1}$, $(s_x^{q_1}, w_x^{q_1}, F_x^{q_1}) = (s_x^{p^*}, w_x^{p^*}, F_x^{p^*})$

We now check that $q_1 \in \mathbb{N}_Q$. The requirements of Definition 4.1 are satisfied below (resp. above) rank α because q_0 (resp. p^*) is a condition. Consider what they say at rank α . The first clause is trivial. The fourth holds because the $s_x^{q_1}$'s all have domain L . The third clause can be checked in two cases.

- (i) If $x \in D_\alpha^{p^*}$, then $D_{\leq x}^{q_1} = (D^p \cup D^{p^*})_{\leq x} = D_{\leq x}^{p^*}$, so $\sum\{w_z^{q_1} : z \in D_{\leq x}^{q_1}\} = \sum\{w_z^{p^*} : z \in D_{\leq x}^{p^*}\} \leq l_\alpha^{p^*} \leq L$.
- (ii) If $x \in D_\alpha^p \setminus D_\alpha^{p^*}$, then $D_{\leq x}^{q_1} = D_{\leq x}^p \cup D_{\leq x}^{p^*}$, so $\sum\{w_z^{q_1} : z \in D_{\leq x}^{q_1}\} = \sum\{w_z : z \in D_{\leq x}^p \cup D_{\leq x}^{p^*}\} \leq \sum\{w_z : z \in D_\alpha^p \cup D_\alpha^{p^*}\} \leq L$.

For the second, all the requirements except that the $s_x^{q_1}$'s are partial slaloms follow from the fact that p and p^* are conditions. We need to check that $|s_x^*(n)| \leq n$ for each relevant n . If $x \in D_\alpha^{p^*}$, then for $l_\alpha^{p^*} \leq n < L$, we have $|s_x^*(n)| \leq \sum \{w_z^{p^*} : z \in D_{\leq x}^{p^*}\} \leq |s_x^{p^*}| = l_\alpha^{p^*} \leq n$. If $x \in D_\alpha^p \setminus D_\alpha^{p^*}$, we consider three cases.

Case 1. $l_\alpha^p \leq n < \max\{l_\alpha^{p^*}, l_\alpha^p\}$. In order for this case to be non-vacuous, we must have $\alpha \in \bar{D}^{p \upharpoonright B}$. Then Definition 4.1(9) for $p^* \leq p \upharpoonright B$ with $E = D_{\leq x}^p \cap D^{p^*}$ gives

$$\begin{aligned} |s_x^*(n)| &\leq \sum \{w_z^p : z \in E\} + (n - l_\alpha^p) + \sum \{w_z^p : z \in D_{\leq x}^p \setminus E\} \\ &= \sum \{w_z^p : z \in D_{\leq x}^p\} + (n - l_\alpha^p) \\ &\leq l_\alpha^p + (n - l_\alpha^p) = n. \end{aligned}$$

Case 2. $\max\{l_\alpha^{p^*}, l_\alpha^p\} \leq n < L$. If $\alpha \in \bar{D}^{p \upharpoonright B}$, then Definition 4.1(8) for $p^* \leq p \upharpoonright B$ gives

$$\sum \{w_z^{p^*} : z \in D_\alpha^{p^*}\} \leq \sum \{w_z^p : z \in D_\alpha^{p \upharpoonright B}\} + (l_\alpha^{p^*} - l_\alpha^p).$$

Removing terms with $z \not\leq x$ from both sides (see Remark 4.2) gives

$$\sum \{w_z^{p^*} : z \in D_{\leq x}^{p^*}\} \leq \sum \{w_z^p : z \in D_{\leq x}^p \cap B\} + (l_\alpha^{p^*} - l_\alpha^p).$$

From the formula for $s_x(n)$ we now get

$$\begin{aligned} |s_x(n)| &\leq \sum \{w_z^{p^*} : z \in D_{\leq x}^{p^*}\} + \sum \{w_z^p : z \in D_{\leq x}^p \setminus B\} \\ &\leq \sum \{w_z^p : z \in D_{\leq x}^p \cap B\} + (l_\alpha^{p^*} - l_\alpha^p) + \sum \{w_z^p : z \in D_{\leq x}^p \setminus B\} \\ &= \sum \{w_z^p : z \in D_{\leq x}^p\} + (l_\alpha^{p^*} - l_\alpha^p) \\ &\leq l_\alpha^p + (l_\alpha^{p^*} - l_\alpha^p) = l_\alpha^{p^*} \leq n. \end{aligned}$$

If $\alpha \notin \bar{D}^{p \upharpoonright B}$, then $B_\alpha = \emptyset$, so $\alpha \notin \bar{D}^{p^*}$. The formula for $s_x^*(n)$ thus reduces to $s_x^*(n) = \bigcup \{K'_{z,n} : z \in D_{\leq x}^p\}$, and hence $|s_x^*(n)| \leq \sum \{w_z^p : z \in D_{\leq x}^p\} \leq l_\alpha^p \leq n$.

Thus, q_1 is a condition. We now check Definition 4.1(5–9) for $q_1 \leq p^*$ and $q_1 \leq p \upharpoonright B \cup Q_{<\alpha+1}$. (We only need the latter, but the former is needed at one point of the proof.) Clause 5 follows from the definition of q_1 . For clauses 6–9, first note that below rank α , they hold because $q_0 \leq p \upharpoonright \alpha$ and $q_0 \leq p^* \upharpoonright \alpha$. Consider what happens at rank α . Clause 6 holds because for $x \in D_\alpha^p \cup D_\alpha^{p^*}$ and all the relevant values of f and n , we have from the definitions that $q_0 \Vdash \dot{f}(n) \in K_{x,n}$ and $K_{x,n} \subseteq s_x^*(n)$. For clause 7, we consider three cases. Let $x < y$ be elements of $D_\alpha^p \cup D_\alpha^{p^*}$.

- (i) If $x, y \in D_\alpha^{p^*}$, then for checking $q_1 \leq p^*$, just use the monotonicity of $s_x^*(n)$ as a function of x . For checking $q_1 \leq p \upharpoonright B \cup Q_{<\alpha+1}$, we also need to consider values of n such that $l_\alpha^p \leq n < l_\alpha^{p^*}$. But then $s_x^*(n) = s_x^{p^*}(n) \subseteq s_y^{p^*}(n) = s_y^*(n)$ because $p^* \leq p \upharpoonright B$.

This is the only case to consider for checking clause 7 for $q_1 \leq p^*$ at stage α . The remaining cases deal with checking $q_1 \leq p \upharpoonright B \cup Q_{<\alpha+1}$. Note that if $y \in D_\alpha^{p^*} \cap D_\alpha^p = D_\alpha^p \cap B$ then also $x \in D_\alpha^{p^*} \cap D_\alpha^p$ since B is downward closed.

- (ii) If $x, y \in D_\alpha^p \setminus D_\alpha^{p^*}$, use the monotonicity of $s_x^*(n)$ as a function of x .

- (iii) If $x \in D_\alpha^{p^*} \cap D_\alpha^p$ and $y \in D_\alpha^p \setminus D_\alpha^{p^*}$, then consider first a value of n such that $l_\alpha^p \leq n < l_\alpha^{p^*}$. We have $s_x^*(n) = s_x(n) \subseteq \bigcup \{s_z(n) : z \in D_{\leq y}^p \cap D_\alpha^{p^*}\} \subseteq s_y^*(n)$. Next consider n such that $l_\alpha^{p^*} \leq n < L$. We have $s_x^*(n) = \bigcup \{K'_{z,n} : z \in D_{\leq x}^{p^*}\} \subseteq \bigcup \{K'_{z,n} : z \in (D_\alpha^p \cup D_\alpha^{p^*})_{\leq y}\} = s_y^*(n)$.

That takes care of clause 7. Clause 8 follows from the fact that if $\alpha \in \bar{D}^{p^*}$, then from the definition of L we have $\sum \{w_x : x \in D_\alpha^{p^*} \cup D_\alpha^p\} \leq L - l_\alpha^{p^*}$, and if $\alpha \in \bar{D}_\alpha^p \setminus \bar{D}_\alpha^{p^*}$, then $\sum \{w_x : x \in D_\alpha^{p^*} \cup D_\alpha^p\} \leq L - l_\alpha^p$. For

clause 9, first we check $q_1 \leq p^*$. If $\alpha \in \bar{D}^{p^*}$, $E \subseteq D_\alpha^{p^*}$ is downward closed in $D_\alpha^{p^*}$ and $l_\alpha^{p^*} \leq n < L$, then $|\bigcup\{s_x^*(n) : x \in E\}| = |\bigcup\{K'_{x,n} : x \in E\}| \leq \sum\{w_x^{p^*} : x \in E\}$. Next we check $q_1 \leq p \restriction B \cup Q_{<\alpha+1}$. Note that the elements of rank α are the same for the domains of p and $p \restriction B \cup Q_{<\alpha+1}$. Also $\alpha \in D_\alpha^p$ since $a \in D^p$. Let $E \subseteq D_\alpha^p$ be downward closed. Consider two cases.

Case 1. $l_\alpha^p \leq n < l_\alpha^{p^*}$. We have

$$\begin{aligned} |\bigcup\{s_x^*(n) : x \in E\}| &= |\bigcup\{s_x^*(n) : x \in E \cap B\} \cup \bigcup\{s_x^*(n) : x \in E \setminus B\}| \\ &= |\bigcup\{s_x^{p^*}(n) : x \in E \cap B\} \cup \bigcup\{K'_{x,n} : x \in E \setminus B\}| \\ &\leq \sum\{w_x^{p \restriction B} : x \in E \cap B\} + (n - l_\alpha^p) + \sum\{w_x^p : x \in E \setminus B\} \\ &= \sum\{w_x^p : x \in E\} + (n - l_\alpha^p). \end{aligned}$$

Case 2. $\max\{l_\alpha^{p^*}, l_\alpha^p\} \leq n < L$. Let $E' = \{z \in D_\alpha^{p^*} : \text{for some } x \in E, z \leq x\}$. We have

$$\begin{aligned} |\bigcup\{s_x^*(n) : x \in E\}| &= |\bigcup\{s_x^*(n) : x \in E \cap B\} \cup \bigcup\{s_x^*(n) : x \in E \setminus B\}| \\ &= |\bigcup\{K'_{x,n} : x \in E'\} \cup \bigcup\{K'_{x,n} : x \in E \setminus B\}| \\ &\leq \sum\{w_x^{p^*} : x \in E'\} + \sum\{w_x^p : x \in E \setminus B\}. \end{aligned}$$

If E' is empty, then this last expression is $\leq \sum\{w_x^p : x \in E\}$. If not, then Definition 4.1(8) applied to $p^* \leq p \restriction B$ (with terms outside E' eliminated from both sides) gives that

$$\begin{aligned} &\sum\{w_x^{p^*} : x \in E'\} + \sum\{w_x^p : x \in E \setminus B\} \\ &\leq \sum\{w_x^p : x \in E \cap B\} + (l_\alpha^{p^*} - l_\alpha^p) + \sum\{w_x^p : x \in E \setminus B\} \\ &= \sum\{w_x^p : x \in E\} + (l_\alpha^{p^*} - l_\alpha^p) \\ &\leq \sum\{w_x^p : x \in E\} + (n - l_\alpha^p). \end{aligned}$$

Thus, the conditions for $q_1 \leq p^*$ and $q_1 \leq p \restriction B \cup Q_{<\alpha+1}$ hold up to rank α . Above rank α , q_1 agrees with p^* , so Definition 4.1(6–9) hold trivially for $q_1 \leq p^*$. For $q_1 \leq p \restriction B \cup Q_{<\alpha+1}$ we need to prove the clauses for $\xi > \alpha$. All of them follow from the fact that $p^* \leq p \restriction B$, $q_1 \restriction \xi \leq p^* \restriction \xi$, and q_1 agrees with p^* at rank ξ . (The fact that $q_1 \restriction \xi \leq p^* \restriction \xi$ is used to check the last part of clause 6.)

Now we apply Lemma 4.6 to p and q_1 , and we get $q \in \mathbb{N}_Q$ such that $q \leq p$ and $q \restriction \dot{r}_b(m) \in s_a^q(m)$. $\square$

Now we have the following main theorem.

Theorem 5.11. *Let $\mathcal{N}$ be the collection of null sets in 2^ω . Suppose that Q is a partially ordered set such that every countable subset of Q has a strict upper bound in Q . Then in any forcing extension by $\mathbb{N}_Q$, $(\mathcal{N}, \subseteq)$ contains a cofinal subset $\{H_a : a \in Q\}$ which is order-isomorphic to $(Q, \leq)$, that is,*

1. *for every $X \in \mathcal{N}$ there is $a \in Q$ such that $X \subseteq H_a$, and*
2. *for $a, b \in Q$, $H_a \subseteq H_b$ if and only if $a \leq b$.*

Acknowledgement

The authors thank J. Zapletal for pointing out the relevance of the result of Hjorth mentioned in the introduction. They also thank T. Bartoszyński, J. Brendle, S. Fuchino, S. Kamo and T. Miyamoto for their helpful comments, suggestions and discussion during this work.
